Information**

## 1.1 Introduction

---

AAEON, a leading Industrial PC manufacturer, announces the debut of a high performance full-size Single Board Computer, the FSB-H81H. AAEON has developed this full-size SBC based on the latest Intel® H81 chipset and the Intel® 4<sup>th</sup> generation Core™ i7/i5/i3 LGA 1150 processor, to fulfill the increasing demands of multi-core processing.

In a PICMG 1.3 SHB Express form factor the FSB-H81H system host board takes full advantage of the Intel® H81 chipset for enhanced system performance and generous expansion capabilities. Two DIMM slots of dual-channel DDR3/DDR3L 1333/1600 sockets provide ample memory bus bandwidth for demanding applications. Moreover, this model equips six COM (four RS-232, and two RS-232/422/485), two USB3.0, and six USB2.0. In addition to the features above, the FSB-H81H deploys two SATA 6.0Gb/s and two SATA 3.0Gb/s. The FSB-H81H has been designed for users that require high performance and reliability for critical applications.

## 1.2 Features

---

- Intel® 4<sup>th</sup> Generation Core™ i7/i5/i3 LGA 1150 Processor
- Intel® H81 Chipset
- Dual-Channel DDR3/DDR3L 1333/1600 DIMM Socket x 2 (Up to 16 GB)
- Intel® H81 Integrated Intel® HD Graphics
- Gigabit Ethernet x 2
- SATA 6.0 Gb/s x 2, SATA 3.0 Gb/s x 2
- COM x 6 (RS-232 x 4, RS-232/422/485 x 2)
- USB3.0 x 2 (On bracket), USB2.0 x 6
- PICMG 1.3
- ATX 2.1 Power Requirement

**Note:** When FSB-H81H is accompanied external Gigabit Ethernet card through PCIe slots on backplane, the Ethernet works smoothly. However, when both Gigabit Ethernet ports are used simultaneously, the Ethernet performance may be decreasing.

**Quick  
Installation  
Guide**

## 2.1 Safety Precautions

---

**Warning!**

*Always completely disconnect the power cord from your board whenever you are working on it. Do not make connections while the power is on, because a sudden rush of power can damage sensitive electronic components.*

**Caution!**

*Always ground yourself to remove any static charge before touching the board. Modern electronic devices are very sensitive to static electric charges. Use a grounding wrist strap at all times. Place all electronic components on a static-dissipative surface or in a static-shielded bag when they are not in the chassis*

## 2.6 Setting Jumpers

---

You configure your card to match the needs of your application by setting jumpers. A jumper is the simplest kind of electric switch. It consists of two metal pins and a small metal clip (often protected by a plastic cover) that slides over the pins to connect them. To “close” a jumper you connect the pins with the clip.

To “open” a jumper you remove the clip. Sometimes a jumper will have three pins, labeled 1, 2 and 3. In this case you would connect either pins 1 and 2 or 2 and 3.

A pair of needle-nose pliers may be helpful when working with jumpers.

If you have any doubts about the best hardware configuration for your application, contact your local distributor or sales representative before you make any change.

Generally, you simply need a standard cable to make most connections.

**AMI  
BIOS Setup**

### 3.1 System Test and Initialization

---

These routines test and initialize board hardware. If the routines encounter an error during the tests, you will either hear a few short beeps or see an error message on the screen. There are two kinds of errors: fatal and non-fatal. The system can usually continue the boot up sequence with non-fatal errors.

#### System configuration verification

These routines check the current system configuration stored in the CMOS memory and BIOS NVRAM. If system configuration is not found or system configuration data error is detected, system will load optimized default and re-boot with this default system configuration automatically.

There are four situations in which you will need to setup system configuration:

1. You are starting your system for the first time
2. You have changed the hardware attached to your system
3. The system configuration is reset by Clear-CMOS jumper
4. The CMOS memory has lost power and the configuration information has been erased.

The FSB-H81H CMOS memory has an integral lithium battery backup for data retention. However, you will need to replace the complete unit when it finally runs down.

## 3.2 AMI BIOS Setup

---

AMI BIOS ROM has a built-in Setup program that allows users to modify the basic system configuration. This type of information is stored in battery-backed CMOS RAM and BIOS NVRAM so that it retains the Setup information when the power is turned off.

### Entering Setup

Power on the computer and press <Del> or <F2> immediately. This will allow you to enter Setup.

### Main

Set the date, use tab to switch between date elements.

### Advanced

# Programming the Watchdog Timer

## A.1 Programming

FSB-H81H utilizes FINTEK 81866 chipset as its watchdog timer controller. Below are the procedures to complete its configuration and the AAEON initial watchdog timer program is also attached based on which you can develop customized program to fit your application.

### Configuring Sequence Description

After the hardware reset or power-on reset, the FINTEK 81866 enters the normal mode with all logical devices disabled except KBC. The initial state (enable bit) of this logical device (KBC) is determined by the state of pin 121 (DTR1#) at the falling edge of the system reset during power-on reset.

There are three steps to complete the configuration setup: (1) Enter the MB PnP Mode; (2) Modify the data of configuration registers; (3) Exit the MB PnP Mode. Undesired result may occur if the MB PnP Mode is not exited normally.

### (1) Enter the MB PnP Mode

To enter the MB PnP Mode, four special I/O write operations are to be performed during Wait for Key state. To ensure the initial state of the key-check logic, it is necessary to perform four write operations to the Special Address port (2EH). Two different enter keys are provided to select configuration ports (2Eh/2Fh) of the next step.

-o 4e 87

-o 4e 87                   ( enable configuration )

### (2) Modify the Data of the Registers

All configuration registers can be accessed after entering the MB PnP Mode. Before accessing a selected register, the content of Index 07h must be changed to the LDN to which the register belongs, except some Global registers.

### (3) Exit the MB PnP Mode

Write exit key 0xAA to the index port.

-o 4e aa                   ( disable configuration )

## Watch Dog Timer 1, 2, 3 Control Register (Index=F5h,F6h,FAh Default=00h)

### 7.8.4 Watchdog Control Configuration Register 1 — Index F5h

Bit	Name	R/W	Reset	Default	Description
7	Reserved	R	-	0	Reserved
6	WDTMOUT_STS	R/W	5VSB	0	If watchdog timeout event occurred, this bit will be set to 1. Write a 1 to this bit will clear it to 0.
5	WD_EN	R/W	5VSB	0	If this bit is set to 1, the counting of watchdog time is enabled.
4	WD_PULSE	R/W	5VSB	0	Select output mode (0: level, 1: pulse) of RSTOUT# by setting this bit.
