Safety Precautions

Please read the following safety instructions carefully. It is advised that you keep this manual for future reference.

1. All cautions and warnings on the device should be noted.
2. All cables and adapters supplied by AAEON are certified and in accordance with the material safety laws and regulations of the country of sale. Do not use any cables or adapters not supplied by AAEON to prevent system malfunction or fires.
3. Make sure the power source matches the power rating of the device.
4. Position the power cord so that people cannot step on it. Do not place anything over the power cord.
5. Always completely disconnect the power before working on the system's hardware.
6. No connections should be made when the system is powered as a sudden rush of power may damage sensitive electronic components.
7. If the device is not to be used for a long time, disconnect it from the power supply to avoid damage by transient over-voltage.
8. Always disconnect this device from any AC supply before cleaning.
9. While cleaning, use a damp cloth instead of liquid or spray detergents.
10. Make sure the device is installed near a power outlet and is easily accessible.
11. Keep this device away from humidity.
12. Place the device on a solid surface during installation to prevent falls.
13. Do not cover the openings on the device to ensure optimal heat dissipation.
14. Watch out for high temperatures when the system is running.
15. Do not touch the heat sink or heat spreader when the system is running.
16. Never pour any liquid into the openings. This could cause fire or electric shock.

17. As most electronic components are sensitive to static electrical charge, be sure to ground yourself to prevent static charge when installing the internal components. Use a grounding wrist strap and contain all electronic components in any static-shielded containers.
18. If any of the following situations arises, please the contact our service personnel:
 - i. Damaged power cord or plug
 - ii. Liquid intrusion to the device
 - iii. Exposure to moisture
 - iv. Device is not working as expected or in a manner as described in this manual
 - v. The device is dropped or damaged
 - vi. Any obvious signs of damage displayed on the device
19. **DO NOT LEAVE THIS DEVICE IN AN UNCONTROLLED ENVIRONMENT WITH TEMPERATURES BEYOND THE DEVICE'S PERMITTED STORAGE TEMPERATURES (SEE CHAPTER 1) TO PREVENT DAMAGE.**

Warning!

This device complies with Part 15 FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received including interference that may cause undesired operation.

Caution:

There is a danger of explosion if the battery is incorrectly replaced. Replace only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer's instructions and your local government's recycling or disposal directives.

Attention:

Il y a un risque d'explosion si la batterie est remplacée de façon incorrecte. Ne la remplacer qu'avec le même modèle ou équivalent recommandé par le constructeur. Recycler les batteries usées en accord avec les instructions du fabricant et les directives gouvernementales de recyclage.

AMI BIOS Setup

3.1 System Test and Initialization

The system uses certain routines to perform testing and initialization during the boot up sequence. If an error, fatal or non-fatal, is encountered, the system will output a few short beeps or an error message. The board can usually continue the boot up sequence with non-fatal errors.

The system configuration verification routines check the current system configuration against the values stored in the CMOS memory. If they do not match, an error message will be output, and the BIOS setup program will need to be run to set the configuration information in memory.

There are three situations in which the CMOS settings will need to be set or changed:

- Starting the system for the first time
- The system hardware has been changed
- The CMOS memory has lost power and the configuration information is erased

The system's CMOS memory uses a backup battery for data retention. The battery must be replaced when it runs down.

3.2 AMI BIOS Setup

The AMI BIOS ROM has a pre-installed Setup program that allows users to modify basic system configurations, which is stored in the battery-backed CMOS RAM and BIOS NVRAM so that the information is retained when the power is turned off.

To enter BIOS Setup, press or <F2> immediately while your computer is powering up.

The function for each interface can be found below.

Main – Date and time can be set here. Press <Tab> to switch between date elements

Advanced – Access and configure advanced processor options and features.

Chipset – Chipset and host bridge options and features

Security – The setup administrator password can be set here

Boot – Set boot options including boot priority and Quiet Boot option

SDK Guide

5.1 Introduction

This section details some of the features of the AAEON SDK available for your VPC-5620S system including Gyro, Smart PoE, MCU and CAN AP functions. If you have any questions or need assistance, contact an AAEON representative by visiting our support page.

5.2 CAN Bus

5.2.1 CAN Bus Utility

This section details how to use the AAEON CAN Bus Utility application.

CAN Bus Utility Screenshot

Utility Function Description:

1. COM Port number
2. COM Port baud rate. This can be set to the following:

115200
57600
38400
19200
9600

3. Connect/Disconnect button
4. When doing a loop test, if an error occurs, counter will increase by 1. Clear button will reset error count.
5. CAN bus port selector: 0 or 1

6. CAN bus baud rate. Press set button to apply changes. Baud rate can be set to:

125K
500K
1M

7. CAN bus mode: Standard or Extend mode. Press set button to apply change.

Mode	ID Range
Standard Mode	0x000~0x7FF
Extend Mode	0x00000000~0x1FFFFFFF

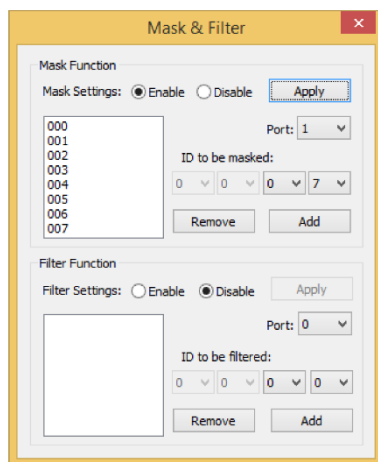

8. Enable or disable RTR mode. Press set button to apply change.

If RTR is enabled, a remote frame will be transmitted via the bus. This means that no data bytes are included within this frame. It is necessary to specify the correct data length code which depends on the corresponding data frame with the same identifier coding. If the RTR is not enabled, a data frame will be sent including the number of data bytes as specified by the data length code.

9. CAN bus ID: The identifier is transmitted on the bus first during the arbitration process. The identifier acts as the message name.

10. Data Field: Data to be transmitted.
11. Received data will be listed here
12. Send button, send the data set in Data Field
13. Loop Test function: Sends data automatically.
14. Receive button: Press to start receiving data.
15. Clear receive field
16. Mask and Filter; opens Mask and Filter menu (detailed on next page).
17. Get status from firmware register
18. Get error status from firmware register
19. Load Default settings
20. Save current settings to firmware register

Mask and Filter Menu

Mask and Filter functions limit which IDs can be received by receiving port.

Mask Function: Specified ID cannot be received.

Filter Function: Only specified ID can be received.

5.5 Smart PoE Utility

5.5.1 About Smart PoE

AAEON Smart PoE application supports monitoring the current and voltage of each PoE port in parallel, as well as the temperature of the PoE controller (IC TSP23861). AAEON Smart PoE offers advanced thermal protection which cuts source power when the temperature of the PoE controller exceeds 154°C, turning PoE mode to OFF status. AAEON Smart PoE provides users with three monitoring modes: Auto, Semi-Auto, and Manual.

Auto

PoE Controller will determine priority to implement Detect, Classification, Power On/Off and Exception Handling.

Semi-Auto

PoE Controller will provide Detection and Classification. Power status is controlled by user.

Manual

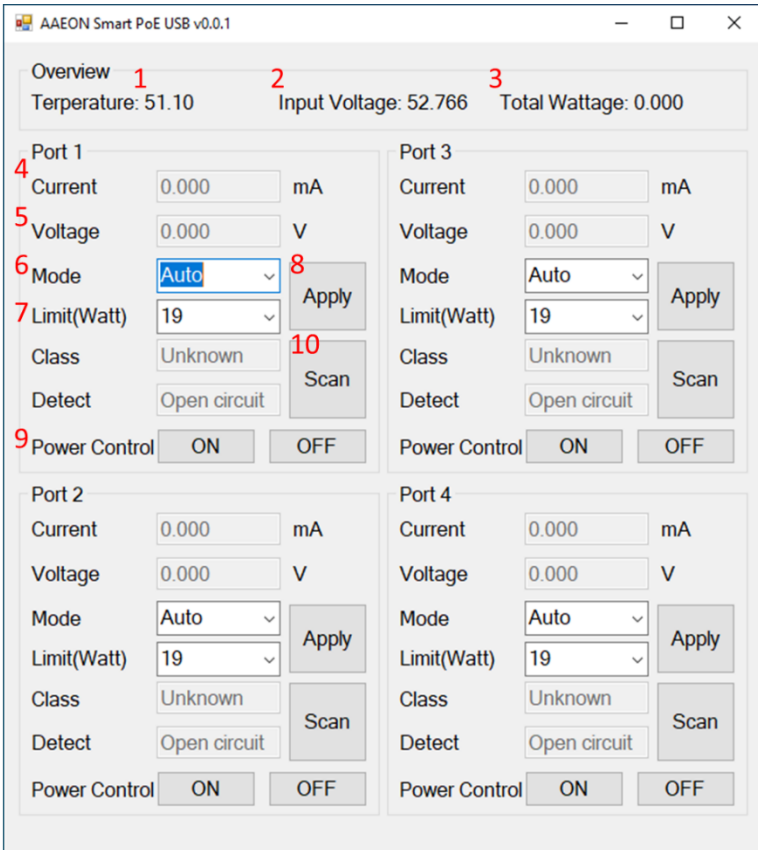

User can force booting power without the controller providing Detection and Classification. User can manually power on/off each port as well as adjust wattage and monitor the PoE controller temperature.

The user can define the power consumption of each PoE port in steps of 6, 11, 19, or 31 Watts under Semi-Auto and Manual mode to protect the device. If power consumption exceeds the settings, the Smart PoE will throttle power to that port.

The VPC-5620S is designed to deliver 60 Watts of power per every four PoE ports. The power budget is a total constraint which cannot be exceeded in the settings. For

example, if the power consumption of Ports 1 and 2 total 50 Watts, the setting for Port 3 cannot be higher than 6 Watts.

5.5.2 Smart PoE Utility Description

1. PoE Controller Temperature
2. PoE Adapter Input Voltage
3. Total Wattage of the four PoE ports
4. Port total current in milliamps
5. Port total voltage in Volts
6. Port PoE Mode: Auto, Semi-Auto, Manual
7. Port Wattage Limit; can be set in Semi-Auto and Manual modes
8. Apply settings to PoE Port
9. Power On/Off PoE Port
10. Scan; rescan to provide classification and detection of connected devices.
