AMI BIOS Setup

3.1 System Test and Initialization

The board uses certain routines to test and initialize board hardware. If the routines encounter an error during the tests, you will either hear a few short beeps or see an error message on the screen. There are two kinds of errors: fatal and non-fatal. The system can usually continue the boot up sequence with non-fatal errors.

System configuration verification routines check the current system configuration stored in the CMOS memory and BIOS NVRAM. If a system configuration is not found or a system configuration data error is detected, the system will load the optimized default and re-boot with this default system configuration automatically.

There are four situations in which you will need to setup system configuration:

- You are starting your system for the first time.
- You have changed the hardware attached to your system.
- The CMOS memory has lost power and the configuration information has been erased.

The COM-WHUC6 CMOS memory uses a backup battery for data retention. The battery must be replaced if it runs out of power.

3.2 AMI BIOS Setup

The AMI BIOS ROM has a built-in Setup program that allows users to modify the basic system configuration. This information is stored in the battery-backed CMOS RAM and BIOS NVRAM so it retains the Setup information when the power is turned off.

To enter Setup, power on the computer and press immediately.

The function of each menu is as follows:

Main – Date and time can be set here. Use <Tab> to switch between date elements.

Advanced – Enable/disable boot option for legacy network devices.

System I/O – System I/O information and configuration.

Security – Password for setup administrator can be set here.

Boot – Enable/disable Quiet Boot option.

Save & Exit – Save changes and exit Setup.

Programming Digital I/O

C.1 Digital I/O Programming

The COM-WHUC6 utilizes an AAEON chipset as its Digital I/O controller.

Below are the procedures to complete its configuration, which you can use to develop a customized program to fit your application.

C.2 Digital I/O Register

Table 1: Embedded BRAM relative register table

	Default Value	Note
Index	0x284(Note1)	BRAM Index Register
Data	0x285(Note2)	BRAM Data Register
Logical Device Number	0xA2(Note3)	Watchdog Logical Device Number
IO Direction Function and Device Number	0x00(Note4)	DIO Input/ Output Function/Device Number
IO Vaule/Status Function and Device Number	0x01(Note5)	DIO Output Data Function/Device Number
